Class05: Data Vis with ggplot

AUTHOR

Nundini Varshney (PID: A16867985)

Graphics systems in R

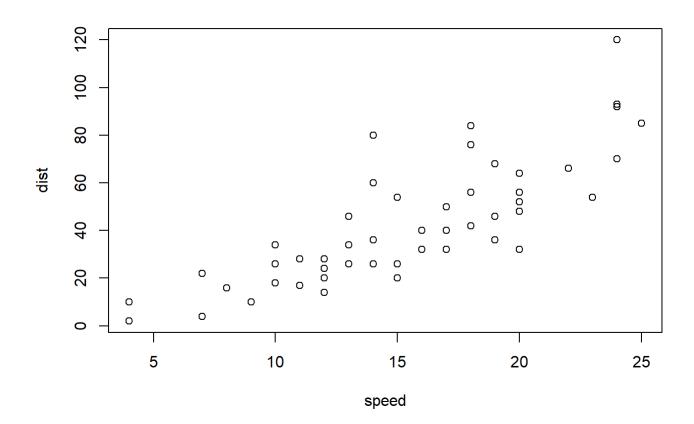

There are many graphics systems in R for making plots and figures.

We have already played a little with "base R" graphics and the plot() function.

Today we will start learning about a popular graphics package called ggplot2().

This is an add on package - i.e. we need to install it. I install it (like I install any package) with the install.packages() function.

plot(cars)

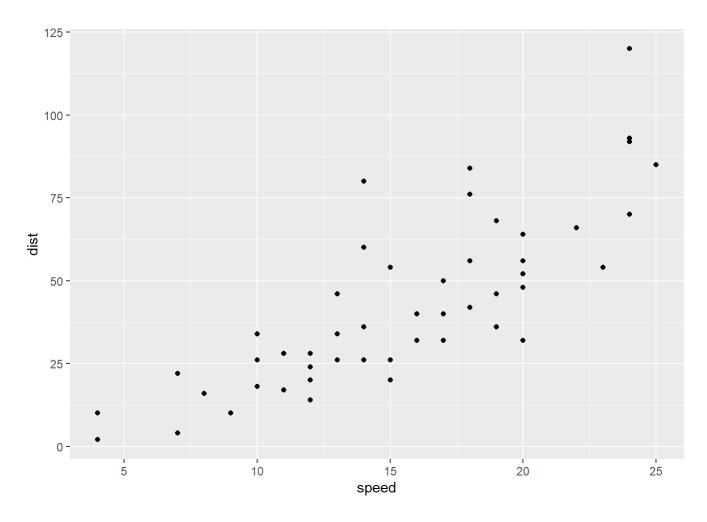

Before I can use the functions from a package I have to load up the package from my "library". We use the library(ggplot2) command to load it up.

```
library(ggplot2)
ggplot(cars)
```

Every ggplot is made up of at least 3 things: - data (the numbers etc. that will go into your plot) - aes (how the columns of data map to the plot aesthetics) - geoms (how the plot actually looks, points, bars, lines, etc.)

```
ggplot(cars) +
aes(x=speed, y=dist) +
geom_point()
```

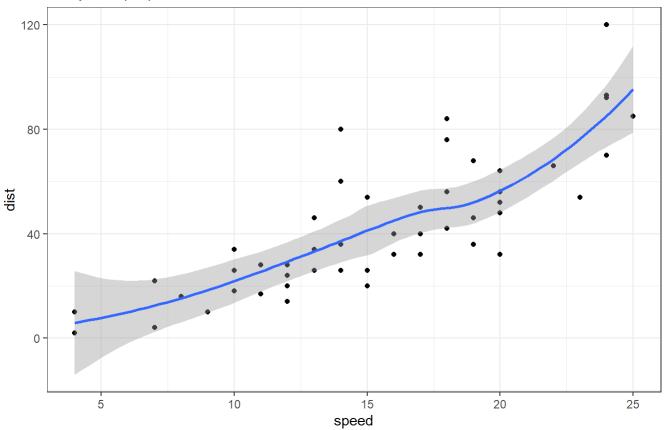

For simple plots ggplot is more verbose - it takes more code - than base R plot.

Add some more layers to our ggplot:

 $[\]ensuremath{\text{`geom_smooth()`}}\ using method = 'loess' and formula = 'y \sim x'$

Stopping distance of old cars

A silly example plot

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)</pre>
```

```
Gene Condition1 Condition2 State

1 A4GNT -3.6808610 -3.4401355 unchanging

2 AAAS 4.5479580 4.3864126 unchanging

3 AASDH 3.7190695 3.4787276 unchanging

4 AATF 5.0784720 5.0151916 unchanging

5 AATK 0.4711421 0.5598642 unchanging

6 AB015752.4 -3.6808610 -3.5921390 unchanging
```

Q. Use the nrow() function to find out how many genes are in this dataset. What is your answer?

```
nrow(genes)
```

[1] 5196

Q. Use the colnames() function and the ncol() function on the genes data frame to find out what the column names are (we will need these later) and how many columns there are. How many columns did you find?

```
colnames(genes)
```

[1] "Gene" "Condition1" "Condition2" "State"

```
ncol(genes)
```

[1] 4

Q. Use the table() function on the State column of this data.frame to find out how many 'up' regulated genes there are. What is your answer?

```
table(genes[,"State"])
```

```
down unchanging up 72 4997 127
```

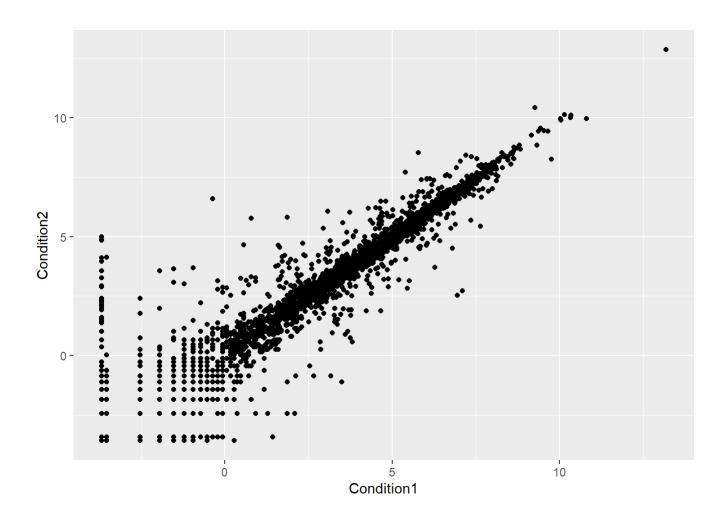

Q. Using your values above and 2 significant figures. What fraction of total genes is up-regulated in this dataset?

```
round(table(genes$State)/nrow(genes) * 100, 2)
```

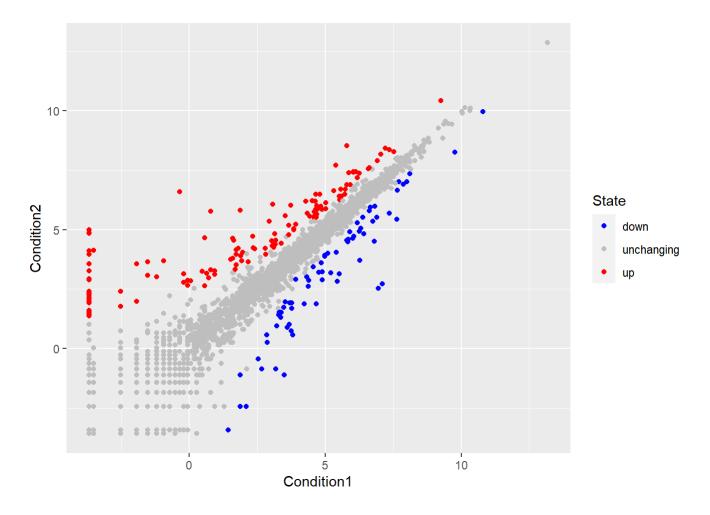

```
down unchanging up 1.39 96.17 2.44
```

Q. Complete the code below to produce the following plot

```
ggplot(genes) +
  aes(x=Condition1, y=Condition2) +
  geom_point()
```

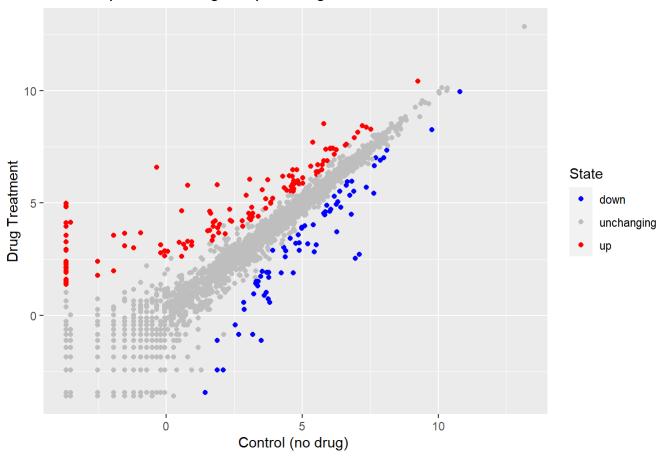

```
p <- ggplot(genes) +
    aes(x=Condition1, y=Condition2, col=State) +
    geom_point()
p + scale_colour_manual( values=c("blue","gray","red") )</pre>
```

Q. Nice, now add some plot annotations to the p object with the labs() function so your plot looks like the following:

Gene Expresion Changes Upon Drug Treatment

```
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.tsv"
gapminder <- read.delim(url)</pre>
```

```
library(dplyr)
```

```
Attaching package: 'dplyr'

The following objects are masked from 'package:stats':

filter, lag

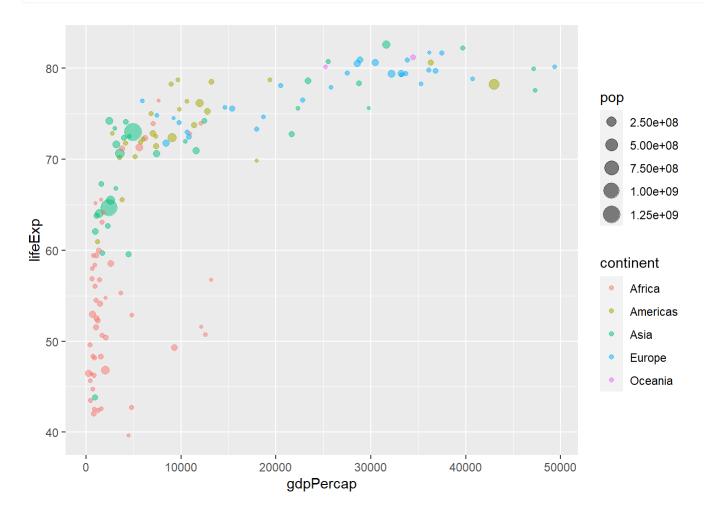

The following objects are masked from 'package:base':

intersect, setdiff, setequal, union
```

gapminder_2007 <- gapminder %>% filter(year==2007)

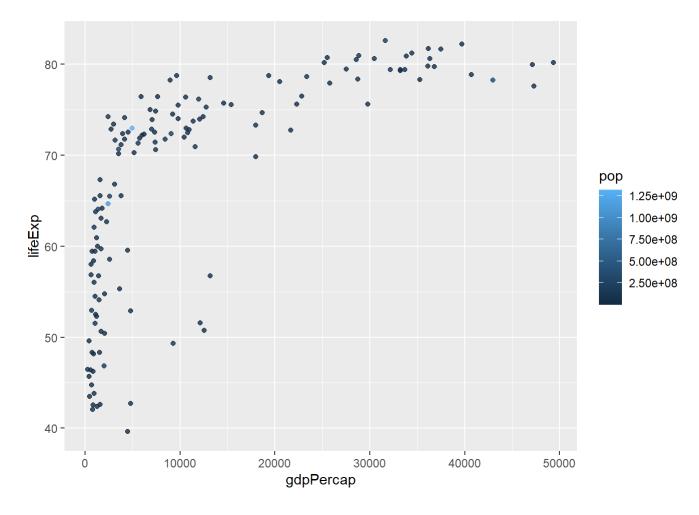

Q. Complete the code below to produce a first basic scater plot of this gapminder_2007 dataset:

```
ggplot(gapminder_2007) +
aes(x=gdpPercap, y=lifeExp, color=continent, size=pop) +
```

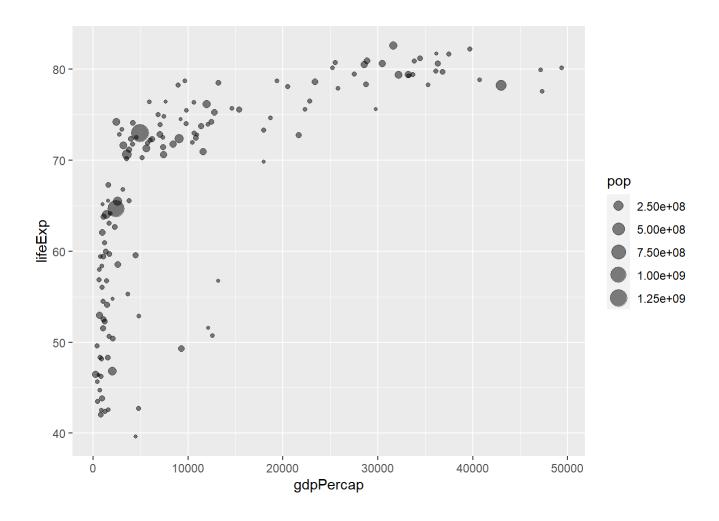

By contrast, let's see how the plot looks like if we color the points by the numeric variable population pop:

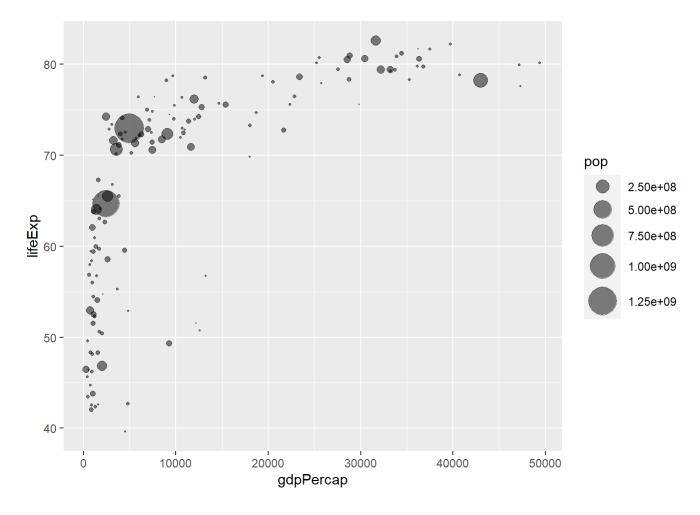

```
ggplot(gapminder_2007) +
aes(x = gdpPercap, y = lifeExp, color = pop) +
geom_point(alpha=0.8)
```

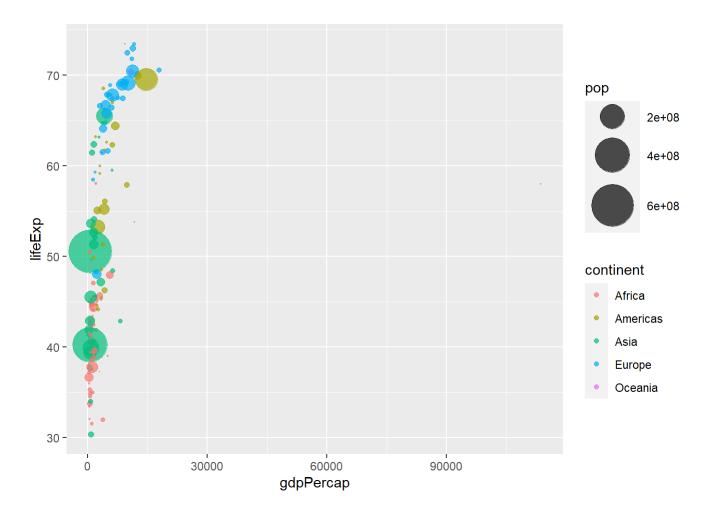

Adjusting point size:

```
ggplot(gapminder_2007) +
aes(x = gdpPercap, y = lifeExp, size = pop) +
geom_point(alpha=0.5)
```

Q. Can you adapt the code you have learned thus far to reproduce our gapminder scatter plot for the year 1957? What do you notice about this plot is it easy to compare with the one for 2007?

Q. Do the same steps above but include 1957 and 2007 in your input dataset for ggplot(). You should now include the layer facet_wrap(~year) to produce the following plot:
